PROFILE	Full-stack engineer, frontend-focused, with 5+ years of web development (Vue 3 years, React 1.5 years). I check empty states, error states and responsive layouts before building, and write down the <i>why</i> and <i>trade-offs</i> behind technical decisions. Led a 4-person frontend/backend team . Most recently built an AI customer-service chatbot platform , using Claude Code daily to navigate large codebases and speed up development.		
SKILLS	Frontend	Vue 3 / Vue 2, React 19, TypeScript, TanStack Query, JavaScript, Next.js, Pinia, Vite, Tailwind CSS, HTML / CSS, RWD	
	Backend	PHP, API design, SQL (MySQL, PostgreSQL, Prisma), NoSQL (Firebase Realtime DB), Auth	
	Tools	Git, Webpack, Vercel, Firebase Hosting, Figma, Code Review, Claude Code (I review every change before merging)	
EXPERIENCE	Frontend Engineer	Smart Training Technology (智訓科技)	2025/02 – 2026/07 · 1 yr 6 mos
	- Built the frontend of a platform where customers create their own AI customer-service chatbots (customized Element Web), configuring prompts, conversation states and exception handling through an intuitive UI. - Used Claude Code to get up to speed on the large Element Web open-source codebase and locate the modules and data flow to change, then reviewed the output myself and rewrote existing logic and integrated Agent-related APIs. - Took over and extended a brand client's warranty management back office (main contributor): email-variable editor, dynamic repair forms, serial-number import/export, member permissions (Portfolio case study →).		
	Full-Stack Engineer	Delta Digital (德塔數位)	2021/07 – 2025/02 · 3 yrs 8 mos
	- Built the frontend and corporate site of an overseas entertainment platform; moved from frontend to full-stack in 2024, owning API design and data-field planning. Tuned slow SQL (index changes, virtual tables, pagination on large tables), taking a page that kept crashing to showing data within 20 seconds. Led a 4-person team (1 frontend, 3 backend) and drove Code Review; pushed a legacy project through a frontend-backend separation to improve maintainability. - Built a Vue tool using the Google Docs API that converts documents into .vue files, cutting each article from 10 minutes to 1 minute (Portfolio case study →); tuned Webpack for PageSpeed; ranked first in output-based performance reviews for multiple months.		
	Frontend Engineer	Phoenix Digital (鳳之梧數位科技), Taipei Branch	2020/06 – 2021/04 · 11 mos
	Worked on a multi-vendor, multi-theme platform: extracted repeated features into shared components (Vue 2) for reuse, and collaborated with backend, design and QA on integration and layout.		
PROJECTS	VocabMaster — Spaced-Repetition Vocabulary App	Full case study →	2026/07 – 09 · Solo
	- Solo build in two months, from planning to deployment: six-stage spaced-repetition scheduler with Server Actions, transactions and exponential-backoff retries; 62 React components, 701 lines of technical notes. - All four charts on the stats page are hand-drawn SVG; fixed three production-only bugs (static prerender freezing data, Prisma in serverless, UTC time zones). AI collaboration: set up the AI as a tutor, not a ghostwriter via AGENTS.md, giving hints but never answers; I implement first, then ask for AI code review and revise. vocal-master-seven.vercel.app · github.com/yooman321/study-hard		
	Live Classroom Q&A System	Full case study →	2022 · Solo · Still in use
	Still used in a university classroom four years after completion, regularly by one instructor, so it had to be stable and usable by non-engineers. - Kahoot-style tool for teachers to pose questions and students to answer live; students join by QR code and nickname, no sign-up. Results can be reviewed afterward by overview, player or question. new-for-class.web.app · github.com/yooman321/new-for-class · Demo account on request		
	EDUCATION	Degree B.S. Computer Science, National Central University (2012–2016) Earlier: software QA, 2016–2019 Languages English: intermediate (TOEIC) · Japanese: basic (JLPT N4) Seeking: full-time, Taichung or remote, immediate start
